Datasets

Atlas of Dermoscopy

- **Educational**
- **Rich Metadata**
- Clinical and dermoscopic images for every case
- Clinical data (location, diameter, elevation)
- Metadata for dermoscopic features.

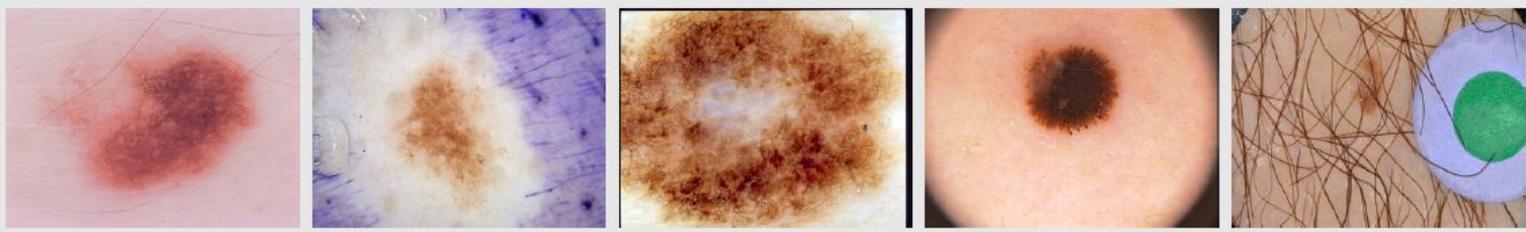

ISIC Archive

- **Large**
- **Diverse**
- Different sources, different devices
- Segmentation masks for lesion (large subset)
- Segmentation masks for dermoscopic features (small subset).

Conclusions

Machine learning results results are probably **optimistic**

Feeding the model with relevant dermoscopic attributes **is worse** than feeding it with “only skin” or “bbox” sets

Solving the bias problem is **critical** for deploying automated skin lesion analysis to the real world
